WHAT IS THE HANTAVIRUS?

TEAM 6

INTRODUCTION

The Hantavirus is a virus that spread through the urine and feces from rodents. There is no specific place where it is the most active. However it appears on most of the places in the world. The most common symptoms are: Headache, Abdominal pain, Nausea and muscle ache. But you can also get severe kidney and lung complaints. People that smoke or live/work with rodents are the most contagious

PREVENTION METHOD 1

the easiest prevention method is that you have to keep your distance with rodents and their urine and feces

PREVENTION METHOD 2

Another preventive method is to keep your opened food in boxes, and to fill up holes in your house so that rodents can't get into your house

WHY WOULD YOU PROTECT YOURSELF FROM THE VIRUS?

The hantavirus is very dangerous because the chance of getting very sick is extremely high, and you could potentially die from this virus. An important thing to know is that the virus can't spread through humans and that the virus stays in the poop for around 2 weeks.
